## **IBM System/360 Transition Aids COBOL Language Differences**

This publication summarizes the System/360 and Current Systems specifications for major IBM COBOL language elements requiring evaluation, and possible conversion, during the transition to IBM System/360 COBOL. System/360 COBOL differences from Current Systems COBOL are also summarized. Where pertinent, the distinction is made between Level E and Level F COBOL for System/360.

## PREFACE

This publication provides a convenient reference to the major language differences between the IBM Current Systems COBOL languages and the IBM System/360 COBOL language.

The information presented in this publication was drawn from the existing IBM COBOL Language manuals (listed under "Prerequisite Knowledge") that contain the specifications for all the Current Systems compilers and the System/360 COBOL compiler. The material presented is entirely dependent upon these publications and derives its authority from them. In cases of conflict this publication does not supersede any of the publications.

## PREREQUISITE KNOWLEDGE

The reader of this publication should have a basic knowledge of the COBOL language, as well as a working knowledge of at least one IBM COBOL compiler.

System/360 COBOL is described in IBM System/360 Operating Systems; COBOL Language, Form C28-6516-2.

The basic COBOL language implemented by the IBM Current Systems compilers is described in Common Business Oriented Language (COBOL); General Information Form F28-8053. In most instances, the specifications contained in the tables in this publication are in addition to the specifications contained in the general information manual. Therefore, a thorough familiarity with the general information manual is essential to the effective use of this publication.

Additional specifications for the individual Current Systems Compilers are contained in the following publications:

COBOL (on Tape) Specifications; IBM 1401, Form C24-1492-1.

COBOL (on Disk) Specifications; IBM 1401, 1440, and 1460, Form C24-3235-1.

IBM 1410/7010 Operating System; COBOL, Form C28-0327-2.

IBM 7040/7044 Operating Systems (16/32K); COBOL Language, Form C28-6336-2.

IBM 7070-Series Programming Systems; COBOL Processor, Form J28-6182-2.

IBM 7070-Series COBOL/FORTRAN Operating System; COBOL, Form C28-6901-1.

IBM 705/7080 Programming Systems; COBOL: Additional Specifications, Form J28-6177-3.

IBM 7090/7094 IBSYS Operating System-Version 13; COBOL Language, Form C28-6391-0. (Note: For the purposes of this publication, differences are based on Version 5 of the 7090/7094 COBOL compiler.)

This publication was prepared for production using an IBM computer to update the text and to control the page and line format. Page impressions for photo-offset printing were obtained for an IBM 1403 Printer with a 120-character chain containing upper and lower case letters, special characters, and numerals.

Copies of this and other IBM publications can be obtained through IBM Branch Offices.

A form for readers' comments appears at the back of this publication. Address any additional comments concerning this publication to the IBM Corporation, Programming Systems Publications, Dept. D39, 1271 Avenue of the Americas, New York, N.Y., 10020.

## ACKNOWLEDGMENT

In accordance with a request contained in COBOL-1961-Extended, the following extract from that manual is presented for the information and guidance of the user:

This publication is based on the COBOL System developed in 1959 by a committee composed of government users and computer manufacturers. The organizations participating in the original development were:

Air Materiel Command, United States Air Force  
Bureau of Standards, Department of Commerce  
David Taylor Model Basin, Bureau of Ships, U. S. Navy  
Electronic Data Processing Division, Minneapolis-Honeywell Regulator Company  
Burroughs Corporation  
International Business Machines Corporation  
Radio Corporation of America  
Sylvania Electric Products, Inc.  
Univac Division of Sperry-Rand Corporation

In addition to the organizations listed above, the following other organizations participated in the work of the Maintenance Group:

Allstate Insurance Company  
Bendix Corporation, Computer Division  
Control Data Corporation  
DuPont Company  
General Electric Company  
General Motors Corporation  
Lockheed Aircraft Corporation  
National Cash Register Company  
Philco Corporation  
Royal McBee Corporation  
Standard Oil Company (N. J.)  
United States Steel Corporation

This manual is the result of contributions made by all of the above-mentioned organizations. No warranty, expressed or implied, is made by any contributor or by the committee as to the accuracy and functioning of the programming system and language. Moreover, no responsibility is assumed by any contributor, or by the committee, in connection therewith.

It is reasonable to assume that a number of improvements and additions will be made to COBOL. Every effort will be made to insure that the improvements and corrections will be made in an orderly fashion, with due recognition of existing users' investments in programming. However, this protection can be positively assumed only by individual implementors.

Procedures have been established for the maintenance of COBOL. Inquiries concerning the procedures and the methods for proposing changes should be directed to the Executive Committee of the Conference on Data Systems Languages.

The authors and copyright holders of the copyrighted material used herein: FLCW-MATIC (Trade-mark of Sperry-Rand Corporation), Programming for the UNIVAC R I and II, Data Automation Systems c 1958, 1959, Sperry-Rand Corporation; IBM Commercial Translator, Form No. F28-8013, copyrighted 1959 by IBM, FACT, DSI 27A5260-2760, copyrighted 1960 by Minneapolis-Honeywell, have specifically authorized the

use of this material, in whole or in part, in the COBOL specifications. Such authorization extends to the reproduction and use of COBOL specifications in programming manuals or similar publications.

Any organization interested in reproducing the COBOL report and initial specifications in whole or in part, using ideas taken from this report or utilizing this report as the basis for an instruction manual or any other purpose is free to do so. However, all such organizations are requested to reproduce this section as part of the introduction to the document. Those using a short passage, as in a book review, are requested to mention "COBOL" in acknowledgement of the source, but need not quote this entire section.

The full potential of the expanded IBM System/360 capability may best be realized by completely redesigning rather than by duplicating current system programs. However, programs written in higher-level languages, such as COBOL, can in most cases be run on System/360 with minor changes. The use of the tables, as indicated in the section "COBOL Differences," should make it possible to annotate an existing program, or to design a projected one, with a minimum of research. Maximum attention could then be given to the task of investigating and resolving conversion problems that are beyond the scope and intention of this publication. In general, there are three major areas -- translation, interpretation, and environment -- that should be considered before attempting cross-computer compatibility.

### TRANSLATION

The first area of conversion is the most straightforward: translation. Because the COBOL language is a common language, the restrictions and extensions imposed on it by individual compilers are few, compared to the broad base that is common to all compilers. Thus, the translation of language formats, while important, does not represent a significant portion of the entire problem. System/360 has maintained the structure and meaning of the basic COBOL language. However, it has restricted some redundant variations for the sake of speed, has eliminated some vocabulary for the sake of conciseness, and has provided some new vocabulary for the sake of greater capability. The tables in this publication will indicate the important translations that will be required when conversion is sought.

### INTERPRETATION

The second area of conversion, interpretation, is somewhat more complex because it involves the problem of how the COBOL language is implemented by various compilers. It is not enough to translate the words; the sense must be translated, as well. When converting a source program from one format to another, great care must be taken to ensure that language elements are compatible in specification and intent, as well as in written format.

The question of interpretation must be considered in the light of the programming principles and concepts that characterize a particular environment. System/360 COBOL is implemented in conjunction with the System/360 Operating System, which employs a concept of device-independence and provides full subprogram capability. System/360 COBOL incorporates a technique, called asynchronous processing, that provides COBOL programs with the capability for multiprogramming. These extended implementations have, necessarily, imposed new and different interpretations on some of the basic COBOL language elements. The tables in this publication will make it possible to compare, in terms of individual compiler specifications, the major language elements that are conversion-sensitive.

## ENVIRONMENT

The third area of conversion is the area of environment. It is only to be expected that a change in environment will necessitate a careful evaluation of those program elements that are environment-oriented. In particular, the following computer characteristics warrant detailed attention:

- Character Set
- Collating Sequence
- Data Classification
- Data Representation
- Input-Output
- Processing Characteristics
- Storage Characteristics

The tables in this publication do not include a detailed treatment of environmental differences. The Environment Division is included merely to indicate the necessity for complete rewriting whenever a program is to be processed for a different computer. A complete discussion of environmental language elements should be sought in the applicable IBM COBOL publications.

The COBOL Differences to be found in the tables are, in fact, the COBOL language elements that differ in format or specification between one or more Current Systems and System/360. The language elements are listed alphabetically in the first column of Table 2. The supplementary columns are intended to provide sufficient information relating to each language element in order that the conversion problem posed by the element can be readily determined.

#### AN EXPLANATION OF THE COLUMNS

Compiler: The following compilers are referred to in the tables:

Abbreviations	COBOL Compiler
1401/40/60	IBM 1401/1460 (on Tape)
	IBM 1401/1440/1460 (on Disk)
1410/7010	IBM 1410/7010 Operating System
7040/7044	IBM 7040/7044 Operating Systems
7070/7074	IBM 7070-Series Programming Systems
7070-FCS	IBM 7070-Series COBOL/FORTRAN Operating System
705/7080	IBM 705/7080 Programming Systems
7090/7094	IBM 7090/7094 Operating System
System/360	Operating System/360

COBOL Language Element: A generic element of the COBOL language; e.g.,

ADD Statement  
File Description Entry  
SIZE ERROR Condition  
USE Sentence

In some cases, for convenience, entries have been included in this column which are not, properly speaking, elements of the COBOL language (for example, CALL Statement).

In general, the presence of a language element in Table 2 indicates that a difference is associated with the element. Furthermore, the presence of certain elements in the table is related to the presence of others. For example, the RECORD CONTAINS Clause, as specified by the 1410/7010 compiler, differs from the System/360 RECORD CONTAINS Clause. One difference lies in the fact that the clause is required in a 1410/7010 File Description Entry, while it is optional in System/360. Therefore, the File Description Entry itself is associated with a difference, and is included in the language element column.

Syntax: This column outlines the basic format of a language element, as implemented by at least one compiler. If the language element is abstract (for example, Collating Sequence), then this column is used to itemize or summarize the particulars concerning the element. The format notation used is described at the end of this section. However, the notation is intended only to indicate the general language formats, and does not supersede the format specifications contained in the applicable IBM COBOL publications.

Additional Specifications or Comment: Specifications indicated in this column are condensed from the applicable IBM COBOL publications and, in

general, represent extensions to the general information manual specifications. Only such specifications as are indicative of a possible difference are denoted. For example, the specifications for the SIZE Clause are limited to the actions taken by the various Current Systems compilers when the clause is omitted, since the clause must be omitted for compatibility with System/360. The fact that System/360 does not implement the clause is indicated by a comment to that effect.

Key Word or Phrase: Any important reserved COBOL word, or descriptive phrase, that appears in the column headed "Syntax" can be referred to as a "Key Word or Phrase."

#### AN EXPLANATION OF THE TABLES

Table 1, Compiler Index to COBOL Differences: This table is designed to provide a recapitulation of differences for each compiler. By referring to the elements listed for his compiler, a programmer can quickly determine which language elements pose a possible conversion problem.

For the Current Systems compilers, differences are always with respect to System/360. For System/360, differences are with respect to at least one Current Systems compiler. For example, the ACCEPT Statement is listed for the 1401/40/60 compilers. This means that the 1401/40/60 ACCEPT Statement is not completely compatible with the System/360 ACCEPT Statement. For particulars concerning the difference, the ACCEPT Statement entry in Table 2 should be consulted. On the other hand, the fact that ACCEPT Statement is listed for System/360 indicates that the System/360 ACCEPT Statement is incompatible with at least one Current Systems compiler.

Table 2, COBOL Differences: The information contained in this table constitutes a complete presentation of COBOL language differences, insofar as they are discussed in this publication. Each conversion-sensitive language element is listed alphabetically in the first column, together with the syntax(es) and specifications associated with the compiler(s) involved.

Whenever possible, entries that indicated similarities were eliminated from the table; thus, the table is intended only to consider differences.

For example, the 7070-FOS compiler is not listed for the NOTE Statement entry, since the 7070-FOS compiler's NOTE Statement is completely compatible with System/360, in both directions. That is, a 7070-FOS NOTE Statement is always compatible with System/360, and a System/360 NOTE Statement is always compatible with the 7070-FOS compiler.

However, omission does not always imply compatibility. The fact that the 1401/1440/1460 compilers are not listed for the USAGE clause does not mean that there is complete compatibility with System/360. In fact, the 1401/1440/1460 compilers do not implement a USAGE clause. The ambiguity of omission may be resolved by referring to an element in the table that subordinates the element in question. Thus, by referring to the entry "Procedure Verbs" it may be determined that the 7070-FOS compiler implements the NOTE verb. Similarly, by referring to the entry "Record Description Entry" it may be determined that 1401/1440/1460 compiles do not implement the USAGE clause.

It is not intended that all the information associated with a particular entry in the table is essential for an individual application. If the direction of conversion is from System/360 to a

current compiler, the information associated with the current compiler in question is the most relevant. On the other hand, if the direction is to System/360, then the System/360 syntax and specifications are of the most importance.

Table 3, Key Word Index to COBOL Differences: In order to assist the reader in locating information contained in Table 2, all important COBOL words, and descriptive phrases, which appear anywhere in the "Syntax" column of Table 2, are listed in this table, indicating the language element entry under which they are discussed. The table may be useful in determining the nomenclature used for various language elements. For example, if information is required pertaining to "margins", reference to this table would indicate that "Margin Restrictions" are discussed under the entry "COBOL Program Sheet" in Table 2.

## EXCLUSIONS

The following areas of conversion are excluded from consideration in this publication:

1. Environment-oriented programming considerations are either excluded entirely from the tables, or are treated only generally, merely to indicate their existence.
2. The problem of data conversion is excluded from the tables.
3. The tables do not take the peculiarities of particular compilers into account. If a compiler tolerates liberties taken with its specifications, this publication does not discuss such liberties.
4. For the purposes of conversion, warning messages issued during compilation of a program signify an error and the proper steps should be taken to eliminate them.

## FORMAT NOTATION

Throughout Table 2 of this publication, basic formats are used for various elements of COBOL, as explained in the following paragraphs. This notation is useful in describing COBOL, although it is not part of COBOL.

1. All words printed entirely in capital letters are reserved words. These are words which have preassigned meanings in the COBOL language. In all formats, words in capital letters represent an actual occurrence of those words.
2. All underlined reserved words are required unless the portion of the format containing them is itself optional. These are key words. If any such word is missing or is incorrectly spelled, it is considered an error in the program. Reserved words not underlined may be included or omitted at the option of the programmer. These words are used only for the sake of readability. These words are called optional words.
3. All lower case words represent information which must be supplied by the programmer.
4. Certain groups of words in the formats consist of capitalized portions followed by lower-case or initially capitalized portions. These designate clauses, statements, paragraphs, or entries whose formats are not pertinent to the overall format being described.
5. When material is enclosed in braces ({ }), one, and only one, of the enclosed items is required; the others are to be omitted. The choice is to be determined by the programmer.
6. Square brackets ([ ]) are used to indicate that the enclosed item

may be used or omitted, depending on the requirements of the particular program. When two or more items are stacked within brackets, one or none of them may occur.

7. The ellipsis (...) indicates:

For Systems/360 formats: that the immediately preceding unit may occur once, or any number of times in succession. A unit means either a single lower-case word, or a group of lower-case words and one or more reserved words enclosed in brackets or braces. If a term is enclosed in brackets or braces, the entire unit of which it is a part must be repeated when repetition is specified.

For Current Systems formats: that the last complete element preceding it may occur once, or any number of times in succession. If a group of operands and key words are enclosed within brackets the entire group must be repeated if any repetition is required, not merely the last operand.

Alphabetic Item	level-number { <u>FILLER</u> data-name } [REDEFINES clause] [OCCURS clause] <u>PICTURE</u> IS alpha-form [JUSTIFIED RIGHT] [USAGE IS <u>DISPLAY</u> ] [VALUE IS alphabetic-literal]	Record description clauses which are not shown in this format are specifically forbidden. Mandatory clauses are written without brackets.	System/360
Alphanumeric Item	level-number { <u>FILLER</u> data-name } [REDEFINES clause] [OCCURS clause] <u>PICTURE</u> IS an-form [JUSTIFIED RIGHT] [USAGE IS <u>DISPLAY</u> ] [VALUE IS non-numeric-literal]	Record description clauses which are not shown in this format are specifically forbidden. Mandatory clauses are written without brackets.	System/360
Arithmetic Expressions	Exponentiation Unary Operators	An expression having a succession of exponentiation operators separating a series of operands is evaluated as though parentheses were inserted from the right. Thus, A**B**C is evaluated as though it were written (A** (B**C)).	System/360
		The minus sign is the only allowable unary operator (having only one operand).	
		The floating point feature is required to handle non-integer exponents.	
		When the sequence of execution is not specified by the parentheses, the order of execution of consecutive operations of the same hierarchical level is from left to right.	1401/40/60 705/7080 7070-FOS 7070/7074 7090/7094
		Both the plus and minus signs are valid unary operators.	
		When the sequence of execution is not specified by parentheses, the order of execution of consecutive operations of the same hierarchical level is from left to right.	1410/7010
		Both the plus and minus signs are valid unary operators.	
		Exponents in COMPUTE statements must be integral in value.

This clause is required for form 3 records.	7070/7074
		The CHARACTER(S) option is required when the file consists of variable length records.	1401/40/60 1410/7010
	<u>BLOCK CONTAINS</u> integer-1  <div style="display: inline-block; vertical-align: middle; text-align: center;"> <math>\left\{ \begin{array}{c} \text{RECORD} \\ \text{RECORDS} \\ \text{CHARACTERS} \end{array} \right\}</math> </div>	Refer to the 705/7080 COBOL publication for a complete discussion of this clause.	705/7080
	<u>BLOCK CONTAINS</u> integer-1  <div style="display: inline-block; vertical-align: middle; text-align: center;"> <math>\left\{ \begin{array}{c} \text{RECORD} \\ \text{RECORDS} \\ \text{CHARACTERS} \end{array} \right\}</math> </div>	The CHARACTER(S) option is applicable only when the file consists of form 3 records. The clause is required for form 3 records.	7070-FOS
	<u>BLOCK CONTAINS</u> integer-1 <u>RECORDS</u>	This clause specifies the number of logical records of maximum length in a physical record.	System/360
CALL Statement	<u>CALL</u> $\left\{ \begin{array}{c} \text{linkage-symbol} \\ \text{subprogram-name} \\ \text{system-symbol} \end{array} \right\}$  <div style="display: inline-block; vertical-align: middle; text-align: center;"> <math>\left[ \begin{array}{c} \text{USING} \left\{ \begin{array}{c} \text{file-name-1} \\ \text{data-name-1} \\ \text{literal-1} \end{array} \right\} \dots \end{array} \right]</math> </div> <u>CALL CHAIN USING</u> $\left\{ \begin{array}{c} \text{data-name-1} \\ \text{literal-1} \end{array} \right\}$	The CALL statement specifies the subprogram(s) to be included in the object program. The USING option specifies required parameters for the subprogram.  CALL CHAIN permits the CHAIN feature to be used with the operating system's linkage loader.	1410/7010
	<u>CALL</u> 'entry-name-1' <u>USING</u> $\left\{ \begin{array}{c} \text{data-name-1} \dots \\ \text{file-name-1} \dots \end{array} \right\}$ $\left[ \left\{ \begin{array}{c} \text{file-name-n} \\ \text{data-name-m} \\ \text{[data-name-m+1} \dots] \\ \text{[data-name-m+n]} \end{array} \right\} \right]$ <u>[RETURNING</u> procedure-name-1 ...].	CALL is used in a COBOL main program to transfer to a subprogram. The USING option specifies the parameters that are passed between the main program and the RETURNING option specifies the point in the main program to which control is returned.	7090/7094

Table 2. COBOL DIFFERENCES.

COBOL ELEMENT	SYNTAX	ADDITIONAL SPECIFICATIONS OR COMMENTS	COMPILER
CALL Statement	<u>CALL</u> entry-name [ <u>USING</u> argument-1 ...].	This statement is used to effect transfer of control to a subprogram. Entry-name represents the name of the subprogram's entry point. Argument-1 may be a data-name (when calling a COBOL subprogram) or a data-name, file-name, or procedure-name (when calling a subprogram written in a language other than COBOL).	System/360
	<u>CALL</u> subprogram-1 <u>USING</u> { data-name-1 literal-1 } [ { data-name-2 } ... ] literal-2 }		7070-FOS
Character Set	Character Set	In addition to the complete COBOL character set ('H') the programmer can use, as characters in non-numeric literals, any characters (except the quotation mark) included in the IBM extended BCD interchange character (EBCDIC) set.	System/360
		The IBM character set 'H' must be used for COBOL source programs.  The computer character set may be used for non-numeric literals and for comments.	1401/40/60 1410/7010 7040/7044 7070-FOS 7070/7074 7090/7094
CLASS Clause	<u>CLASS IS</u> { <u>ALPHABETIC</u> <u>NUMERIC</u> <u>ALPHANUMERIC</u> <u>AN</u> }	This clause is not implemented by System/360. A PICTURE clause should be used to express the functions of this clause.	1401/40/60 1410/7010 7040/7044 705/7080 7070/7074 7090/7094
Class Test	data-name IS [ <u>NOT</u> ] { <u>NUMERIC</u> <u>ALPHABETIC</u> }	The item to be tested can be elementary alphanumeric, alphabetic, internal decimal, or external decimal.  The item is tested to determine whether it is solely alphabetic or solely numeric.	System/360

Table 2. COBOL DIFFERENCES.

COBOL ELEMENT	SYNTAX	ADDITIONAL SPECIFICATIONS OR COMMENTS	COMPILER
Class Test	<u>IF</u> data-name IS [NCT] { NUMERIC ALPHABETIC }	Data-name must be defined in the Data Division as an elementary non-report item of the alphanumeric class.  The item is tested to determine whether it is solely alphabetic or solely numeric.	7070-FCS
		Data-name must be defined in the Data Division as being of the alphanumeric class. The item is tested to determine whether it is solely alphabetic or solely numeric.	1401/40/60 1410/7010 7040/7044 705/7080 7070/7074 7090/7094
CLOSE Statement	<u>CLOSE</u> file-name-1 [ WITH { LOCK NO REWIND } ] [file-name-2...]	The 1401/40/60 compiler does not provide the ability to process a given file as both an input file and an output file in the same program, unless it is a direct-access file.	1401/40/60
	<u>CLOSE</u> file-name-1 [UNIT] [ WITH { LOCK NO REWIND } ] [file-name-2...]	The reserved word UNIT replaces the current systems equivalent, REEL.  If the UNIT option is specified, the IOCS volume switching procedures are instituted. The LOCK option causes the current volume of the file to be removed.	System/360
	<u>CLOSE</u> file-name-1 [REEL] [ WITH { LOCK NO REWIND } ] [file-name-2...]	The REEL option is used when a reel of a file is to be closed prior to its normal end.	1410/7010 7040/7044 7070/7074 7090/7094
	<u>CLOSE</u> file-name-1 [WITH LOCK] [file-name-2 ...]		705/7080

Table 2. COBOL DIFFERENCES.

COBOL ELEMENT	SYNTAX	ADDITIONAL SPECIFICATIONS OR COMMENTS	COMPILER
COBOL Program Sheet	Margin Restrictions	For System/360 COBOL, margin A (columns 8 through 11) is restricted to the following entries...  Division Names Section Names Paragraph Names Level Indicators.  No other entries may begin before column 12.	1401/40/60 1410/7010 7040/7044 705/7080 7070/7074 7090/7094
Collating Sequence	Relation Test	Comparison of non-numeric items is with respect to the binary collating sequence of characters in the IBM extended BCD interchange code.	System/360
		Each computer has its own character set, with a specified order of precedence.	1401/40/60 1410/7010 7040/7044 705/7080 7070-FOS 7070/7074 7090/7094
Conditional Statement	IF condition-1 [THEN]  { statement-1... NEXT SENTENCE }  [ { ELSE OTHERWISE } { statement-2... NEXT SENTENCE } ]	For System/360 level E statement-1 must be imperative (no true path nesting is permitted).	System/360
Continuation Indicator	Continuation Indicator	A hyphen must be punched in column 7 of any line in which a word or literal is being continued.	1401/40/60 1410/7010 7040/7044 705/7080 7070/7074 7090/7094
		If compatibility with current systems compilers is desired, a hyphen must be punched in column 7 of each line in which a non-numeric literal is being continued.  Continuation of words or numeric literals is not permitted.	System/360

System/360
RETURN Statement	<u>RETURN</u> [VIA entry-name-1].	The return statement enables restoration of the necessary registers saved at an entry point.	System/360
	<u>RETURN</u> VIA 'entry-name' [ <u>DEPENDING</u> ON data-name]	RETURN is used to identify the end of the Section of the sub-program to be executed and provides for return to the main program. The <u>DEPENDING ON</u> option can be used with the <u>RETURNING</u> option in the <u>CALL</u> statement to specify an alternate return.	7090/7094
Series Separation	AND , ,AND	A series of operands may be separated by the comma, the word AND or the comma followed by the word AND.	1401/40/60 1410/7010 7040/7044 705/7080 7070/7074 7090/7094
		A comma may be used optionally as a separator between successive operands of a statement, or to separate a series of clauses.	System/360
SIGNED Clause	<u>SIGNED</u>	This clause is not implemented by System/360. A PICTURE clause should be used to express the functions of this clause.	1410/7010 System/360 7040/7044 705/7080 7070/7074 7090/7094

Table 2. COBOL DIFFERENCES.

COBOL ELEMENT	SYNTAX	ADDITIONAL SPECIFICATIONS OR COMMENTS	COMPILER
SIZE Clause	<u>SIZE</u> IS [integer-1 <u>TO</u> ] integer-2 { <u>CHARACTER</u> <u>CHARACTERS</u> <u>DIGIT</u> <u>DIGITS</u> } [DEPENDING ON] data-name	This clause is not implemented by System/360. A PICTURE clause should be used to express the functions of this clause.	1401/40/60
	<u>SIZE</u> IS integer-1 { <u>CHARACTER</u> <u>CHARACTERS</u> <u>DIGIT</u> <u>DIGITS</u> }		1410/7010 7040/7044 705/7080 7070/7074 7090/7094
SIZE ERROR Condition	ON <u>SIZE ERROR</u> { statement-1 <u>NEXT SENTENCE</u> statement-2 <u>NEXT SENTENCE</u> { <u>OTHERWISE</u> <u>ELSE</u> } }	The ELSE or OTHERWISE option will cause a warning message to be issued. For compatibility with System/360, the option should not be used.	1401/40/60 705/7080
	ON <u>SIZE ERROR</u> {any imperative state- ment <u>NEXT SENTENCE</u> }		7040/7044
	ON <u>SIZE ERROR</u> imperative-statement		System/360 7090/7094
STOP Statement	<u>STOP</u> { <u>RUN</u> literal}		1401/40/60 7040/7044 705/7080 7070-FOS 7070/7074 7090/7094
		STOP RUN returns control to the operating system.  STOP literal causes a compiler-generated message code, as well as the specified literal, to be displayed. The message code must be keyed in on the console in order to resume.	System/360
		STOP RUN returns control to the system monitor.  STOP literal causes the literal to be displayed, after which the resident monitor wait-loop is entered.	1410/7010

Table 2. COBOL DIFFERENCES.

COBOL ELEMENT	SYNTAX	ADDITIONAL SPECIFICATIONS OR COMMENTS	COMPILER
Subscripting	Subscript Format	System/360 specifies that for multiple subscripting each subscript must be followed by an immediate comma and a blank. For example, data-name (A,B,C) is acceptable, but data-name (A,B,C) is not valid.	7070/7074
SUBTRACT Statement	<u>SUBTRACT CORRESPONDING</u> data-name-1 <u>FROM</u> data-name-2 [ROUNDED] [SIZE ERROR Condition]	SUBTRACT CORRESPONDING is not implemented by the 1401/40/60 and 7070/7074 compilers.	System/360
	<u>SUBTRACT CORRESPONDING</u> data-name-1 <u>FROM</u> data-name-2 [ROUNDED] [SIZE ERROR Condition]	System/360 level E does not implement SUBTRACT CORRESPONDING.	1401/7010 7040/7044 7090/7094 705/7080 7070-FOS
SYNCHRONIZED Clause	<u>SYNCHRONIZED</u> { <u>LEFT</u> <u>RIGHT</u> }	A right synchronized computational item is most efficient for computation. It will appear in the least significant position of a word (2 words if more than ten digits) with its sign bit in the sign position of the word. Numeric computational items without a synchronized clause will occupy the minimum number of six bit blocks capable of holding it and its sign (in the leftmost bit).	7040/7044 7090/7094
		The item will occupy storage in six-bit bytes, although it is computational and therefore specified as being in binary form, when not synchronized.	
		Refer to the applicable COBOL publication for a detailed discussion of the SYNCHRONIZED clause.	705/7080 7070-FOS 7070/7074

Table 2. COBOL DIFFERENCES.

COBOL ELEMENT	SYNTAX	ADDITIONAL SPECIFICATIONS OR COMMENTS	COMPILER
SYNCHRONIZED Clause	<u>SYNCHRONIZED</u> { <u>LEFT</u> <u>RIGHT</u> }	The SYNCHRONIZED clause is never necessary in a System/360 COBOL program. If the clause is specified, it is treated as comments by the compiler.  Storage is assigned so that the starting byte of a binary or internal floating-point item is on the next available half-word, full word, or double word boundary, as appropriate. If a data hierarchy contains binary or floating point items intermixed =slack bytes= (implicit synchronization) may be introduced. Slack bytes are inserted on output and expected on input files.	System/360
		This clause is recognized, but ignored by the 1410/7010 compiler.	1410/7010
Test Condition	Relation Test Sign Test Class Test Condition-name Test Form-overflow Test		System/360
	Relation Test Sign Test Class Test Condition-name Test Switch-status-name Test	The System/360 environment does not provide for testing switch-status.	1401/40/60 7040/7044 705/7080 7070-FOS 7070/7074 7090/7094
Types of Data Items	Group Items  Elementary Item Alphabetic Item Numeric Item Alphabetic Item Report Item Non-report Item	Refer to these specific categories in the 'Language Element' column for information concerning the valid clauses which may be used in their description for System/360.	1401/40/60 1410/7010 7040/7044 705/7080 7070-FOS 7070/7074

Table 2. COBOL DIFFERENCES.

COBOL ELEMENT	SYNTAX	ADDITIONAL SPECIFICATIONS OR COMMENTS	COMPILER
USAGE Clause	USAGE IS <div> <u>COMPUTATIONAL</u>  <u>COMPUTATIONAL-1</u>  <u>COMPUTATIONAL-2</u>  <u>DISPLAY</u> </div>	DISPLAY specifies BCD storage. COMPUTATIONAL specifies binary storage. If a group item is specified COMPUTATIONAL, the elementary items in the group are treated as COMPUTATIONAL, but not the group item itself.  COMPUTATIONAL internal decimal COMPUTATIONAL-1 single precision floating-point COMPUTATIONAL-2 double precision floating-point Note: The only clause required for a floating-point item is USAGE.  COMPUTATIONAL, COMPUTATIONAL-1, and COMPUTATIONAL-2 items are stored in the least multiple of six bits capable of holding the item including its sign.	7090/7094
	USAGE IS <div> <u>COMPUTATIONAL</u>  <u>DISPLAY</u> </div>	COMPUTATIONAL corresponds to 7070 numeric mode, Display corresponds to 7070 alphanumeric mode. Computational and display fields cannot occur in the same machine word. Two or more computational fields in the same machine word must have the same sign. Usage specified at the group level supersedes subordinate specifications.	7070-FOS 7070/7074
		DISPLAY specifies BCD storage. COMPUTATIONAL specifies binary storage.  If a group item is specified COMPUTATIONAL, the elementary items in the group are treated as computational, but not the group item itself.  COMPUTATIONAL items are stored in the least multiple of six bits capable of holding the item including the sign.	7040/7044
		All data represented within the 705/7080 is in external format. Hence, the DISPLAY option is not meaningful and will be ignored. However, if an item is specified as being COMPUTATIONAL, it must be a numeric item.	705/7080

Table 2. COBOL DIFFERENCES.

COBOL ELEMENT	SYNTAX	ADDITIONAL SPECIFICATIONS OR COMMENTS	COMPILER
USAGE Clause	USAGE IS { <u>COMPUTATIONAL</u> <u>DISPLAY</u> }	This clause does not affect internal representation, which is always BCD.  If COMPUTATIONAL is specified, and the CLASS clause is omitted, the item is assumed to be numeric.	1410/7010
	USAGE IS { <u>DISPLAY</u> <u>COMPUTATIONAL</u> <u>COMPUTATIONAL-1</u> <u>COMPUTATIONAL-2</u> <u>COMPUTATIONAL-3</u> }	DISPLAY specifies character form, one character per byte. COMPUTATIONAL specifies a binary item occupying 2, 4, or 8 byte positions corresponding to the specified decimal lengths of 1-4, 5-9, and 10-18 respectively. The leftmost bit of the reserved area is the operational sign. Computational items are aligned at the next half or full word boundaries, as appropriate. COMPUTATIONAL-1 short precision floating point COMPUTATIONAL-2 long-precision floating point COMPUTATIONAL-3 packed decimal	System/360
USE Sentence	<u>USE FOR KEY-CONVERSION ON</u>  { <u>ALL FILES</u> file-name [file-name...] imperative-statement(s)}.	The USE declarative is used to specify the KEY CONVERSION procedure which is to be used for developing disk addresses.	1401/40/60
	<u>USE FOR CREATING</u> [ <u>BEGINNING</u> <u>ENDING</u> ]  <u>LABELS ON OUTPUT</u> [file-name...].  <u>USE FOR CHECKING</u> [ <u>BEGINNING</u> <u>ENDING</u> ]  <u>LABELS ON INPUT</u> [file-name...].  <u>USE FOR RANDOM PROCESSING.</u>  <u>USE BEFORE REPORTING</u> data-name-1.	The first two options are used to provide user label processing procedures. BEGINNING refers to header labels, ENDING refers to trailer labels. Absence of both words indicates processing of both headers and trailers.  The third option is used to specify out-of-line procedural statements for asynchronous processing.  The fourth option is used to designate procedures to be executed by the REPORT WRITER facility.	System/360

Table 2. COBOL DIFFERENCES.

COBOL ELEMENT	SYNTAX	ADDITIONAL SPECIFICATIONS OR COMMENTS	COMPILER
USE Sentence	USE Sentence	Refer to the applicable COBOL publication for detailed discussion of the USE sentence.	7090/7094 7040/7044 1410/7010 7070-FOS
VALUE Clause	$\left\{ \begin{array}{l} \text{VALUE IS} \\ \text{VALUES ARE} \end{array} \right\} \text{ literal-1}$ <p>[THRU literal-2] ...</p>	<p>If the VALUE clause specifies a numeric literal, a sign will be placed over the units position of the numeric field only if the literal is preceded by a plus or minus sign.</p> <p>The THRU option may be used only with condition-names.</p>	1401/40/60
	<u>VALUE</u> IS literal	<p>A VALUE clause can be used...</p> <p>For elementary items only. In File and Linkage Section, in level 88 entries only.</p> <p>The VALUE clause cannot be used:</p> <p>For group items. For report items. For external floating-point items.</p> <p>For items containing, or subordinate to an OCCURS clause or a REDEFINES clause (except for level 88 entries) .</p>	System/360
		<p>A numeric literal with preceding sign does not create an operational sign unless an 'S' appears in an associated PICTURE clause, or a SIGNED clause is used.</p>	1410/7010
		<p>If a PICTURE clause associated with the item contains an implied decimal, the VALUE clause literal must specify the actual decimal. If the VALUE clause is used at the group level, the numeric elementary items which are part of the group can consist only of unsigned, non-scaled integers. The VALUE clause cannot specify more than 120 alphabetic or alphanumeric characters.</p>	7070/7074

Table 2. COBOL DIFFERENCES.

COBOL ELEMENT	SYNTAX	ADDITIONAL SPECIFICATIONS OR COMMENTS	COMPILER
VALUE Clause	<u>VALUE</u> IS literal	System/360 does not permit the use of the VALUE clause in the description of a group item.	7070-FOS
		The VALUE clause cannot be used in an item containing, or subordinate to an OCCURS clause. It cannot be used to specify the initial value of the variable portion of a record following the DEPENDING option.	7040/7044 7090/7094
		The VALUE clause cannot be used to describe a report item. It can be used to describe a group item, provided neither a decimal point nor an operational sign are part of the literal, and the size of the literal is equal to the size of the group item.  A figurative constant may not be used for the predicate of a VALUE clause used at the group level, unless a SIZE clause is also present.	705/7080
VALUE OF Clause	<u>VALUE OF FILE-ID</u> IS external-name	This clause specifies the name by which the file is known to the control program. <u>External-name</u> consists of quotation marks enclosing no more than eight alphabetic and numeric characters, the first of which must be an alphabetic character.  Neither the format nor the purpose of this clause is compatible with current systems usage.	System/360
	<u>VALUE OF FILE-IDENTIFICATION</u> IS literal-1 [ <u>RETENTION-PERIOD</u> IS integer-1]	This clause specifies the contents of data items in the label record of the file. Literal-1 must be a ten-character non-numeric literal. <u>Integer-1</u> must be an integer up to four digits in length.	1410/7010

## ATTACHMENT I

### ENVIRONMENT DIVISION

This division of COBOL is machine-oriented and therefore must be rewritten in its entirety at conversion time. However, to minimize conversion problems avoid the use of:

1. ALTERATION SWITCHES. S/360 does not use physical or electronic switches. Named data switches should be used as replacements.
2. Equating AUTOCODER TAGS and COBOL NAMES not allowed in S/360, for ENTER verb.
3. PROGRAM START. If it is desired to begin object program execution at some procedure other than the first procedure in the program, the first procedure statement should be a GO TO the desired paragraph.
4. SELECT RESTART clause.
5. RERUN clause.

ATTACHMENT I

DATA DIVISION

FILE SECTION.

1. FD entries should be rewritten at conversion time to conform to S/360 requirements, however, the following conventions should be adopted to facilitate the rewriting phase.
  - A. BLOCK CONTAINS Clause.
    - a. The CHARACTERS option is not implemented in S/360.
    - b. Word RECORDS must be plural.
  - B. RECORD CONTAINS Clause.
    - a. Word CHARACTERS must be plural. This clause must be used in S/360 for variable-length records.
  - C. LABEL RECORDS Clause.
    - a. LABEL RECORDS ARE is the only form useable in S/360. The LABEL RECORDS clause is used only to specify user labels which may be omitted; the functions of current - system label procedures, if any, may not be required in S/360 COBOL.
    - b. The STANDARD and NON-STANDARD options are not allowed.
  - D. DATA RECORDS Clause.
    - a. This clause is optional in S/360 since all data record descriptions must follow the File Description.

FILE SECTION AND WORKING-STORAGE SECTION.

DATA RECORD DESCRIPTIONS.

1. ALL "literal." A one-character literal must be used. If more than one type of character is required, use a literal or named constant of the same length as field.
2. ALL "Figurative Constant." This usage not valid in S/360. ALL is redundant, e.g. SPACES is equivalent to ALL SPACES.
3. PICTURE Clause.
  - A. In S/360 this clause is the only permitted means to describe data items. The SIZE, SIGNED, POINT LOCATION, CLASS, CHECK PROTECT, FLOAT DOLLAR SIGN, ZERO SUPPRESS Clauses are not used. The S/360 PICTURE Clause is required for all elementary items except internal floating point.
  - B. Do not use PICTURE Clause for group items.
  - C. X is the only allowable character in an alphanumeric non-report item. The A X 9 combination is not allowed.
  - D. High-order position CR and DR Symbols are not allowed.

ATTACHMENT 1

4. VALUE Clause

- A. Use only at the elementary level.
- B. Cannot be used in report items.
- C. Except in condition names, cannot be stated in an entry which contains or is subordinate to an entry which contains a REDEFINES clause.

5. OCCURS Clause.

- A. The word TIMES must be plural.

6. JUSTIFIED Clause.

In S/360 alphanumeric and alphabetic items are justified left unless JUSTIFIED RIGHT is specified. Numeric items are aligned by decimal point. Therefore, JUSTIFIED LEFT is not permissible in S/360 COBOL.

7. SYNCHRONIZED Clause.

This clause not required in S/360 but it will be accepted by the S/360 Compiler and treated as a comment.

8. REDEFINES Clause.

- A. Data-name-1 may not be subordinate to an item containing an OCCURS clause.
- B. Data-name-2 may not contain or be subordinate to an item containing an OCCURS clause.

CONSTANT SECTION.

There is no Constant Section in S/360 COBOL. Constants should be defined in Working-Storage section.

ATTACHMENT I

PROCEDURE DIVISION

1. Class test.

The Class Test cannot be performed on a group item in S/360 COBOL.

2. Data comparison.

Varying data formats of the S/360 may restrict the comparison of certain items in a data test; e.g. alphabetic and alphanumeric data may not be compared with numeric data.

COBOL VERBS.

READ:

In S/360, processing is done in the input area with registers being adjusted to refer to the proper logical record. This technique eliminates a move to a separate record area as is done in most current systems. This means that the record area will not be available following the READ that caused the AT END procedure to be executed.

Note that a READ INTO will still cause a move to a separate work area.

WRITE:

On a WRITE FROM, the prior record is not available in S/360 COBOL.

CLOSE:

S/360 uses the keyword UNIT instead of REEL, and provides the WITH NO REWIND and LOCK options.

DISPLAY:

This verb causes display on the System Output Unit (SYSOUT) unless SYSPCH (Punch) or CONSOLE is specified. A maximum of 72 data characters may be displayed on the punch or console.

ADD:

S/360 COBOL requires use of the TO or GIVING option with all ADD statements. Statement "ADD CURR-MO., YR-TO-DATE" is invalid.

PERFORM:

The word TIMES must be plural.

ENTER:

S/360 COBOL compiles directly into machine language. Current-system ENTER statements and equating of COBOL names will have to be rewritten. Avoid if possible.

NOTE:

NOTE, when used must begin a sentence.

COBOL PROGRAM SHEET

1. Text on the same line as the paragraph name may not start before column 12, and must be separated from the name by a period followed by at least one space.

ATTACHMENT A

PROPOSED DIVISION

The proposed division is to be performed by the following:

The proposed division is to be performed by the following:

The proposed division is to be performed by the following:

The proposed division is to be performed by the following:

ATTACHMENT I

2. In file description and record description entries, only the level indicator may appear before column 12.
3. S/360 allows continuation of non-numeric literals only. When a non-numeric literal is continued, it must be preceded by a quotation mark which may not appear before column 12.
4. AND. This keyword may not be used as a series separator or connector. It must be replaced with a blank or comma.

PROGRAM-ID in IDENTIFICATION DIVISION.

In S/360 COBOL, program-name must consist of from 1 to 8 alphabetic and/or numeric characters; the first character must be alphabetic.

USE OF PARENTHESES.

In S/360 COBOL, a left parenthesis cannot be followed by a space; a right parenthesis cannot be preceded by a space.

Compliance with the aforementioned specifications when writing current 7080 COBOL programs will minimize the changes necessary when converting to S/360 at a later date.

Attachment II, which follows, points up additional differences between the S/360 and 7080 COBOL which cannot be implemented currently.

ATTACHMENT 1

... and record (see column 12) ... before column 12.

... of non-... (it must be ... before column 12).

... and be ...

... of ...

... of ...

... of ...

... of ...

ATTACHMENT II

OTHER SYSTEM/360 COBOL SPECIFICATIONS THAT WILL CAUSE 7080  
PROGRAMS TO BE CHANGED FOR CONVERSION

1. The characters J and K cannot be used in the PICTURE clause.
2. SOURCE and OBJECT COMPUTER paragraphs will have to be rewritten in System/360 form.
3. MEMORY SIZE clause will not be allowed.
4. PREASSEMBLED IOCS clause will not be allowed in the System/360 operating system environment.
5. In the ASSIGN clause, assignment to specific units will not be allowed because of the device - independence concept of the System/360 operating system.
6. The RENAMING clause is not allowed in System/360.
7. RECORDING MODE clause is not allowed in FD entry.
8. The CHARACTERS option of the BLOCK CONTAINS clause is not implemented.
9. Data files may have to be changed to match the USAGE clause; the USAGE clause changed to match the data files, or a combination of both.
10. Use of the verb ACCEPT causes data to be accepted on the System Input Unit (SYSIN) unless FROM CONSOLE is specified.
11. Standard mnemonic names for specifying input devices, in connection with the ACCEPT verb, are provided.
12. The differences between System/360 and current system data forms may affect use of the MOVE verb.

ATTACHMENT III

GENERAL COMMENTS

1. System/360 COBOL compiles directly into machine language.
2. System/360 operating system does not use the current IOCS.
3. In System/360 no padding records are provided, whether blocked records are fixed or variable.
4. The System/360 label concept consists of a volume label which is completely controlled by the operating system and optional user labels which must be controlled by the user program. Because of the comprehensive volume - label processing which is provided, the functions of current system label procedures may not be required in System/360 COBOL.
5. The STANDARD and NON-STANDARD options and the BEGINNING-LABEL and ENDING LABEL options of the LABEL RECORDS clause are not allowed.
6. The DATA RECORDS clause is optional since all data record description must follow the File Description.
7. In the report form of a System/360 PICTURE, if all digit positions are defined by asterisks and the data field is all zeros, the edited item will consist of all asterisks instead of all blanks.
8. SYNCHRONIZED clause is never required because binary and floating point items are automatically synchronized. However, it will be accepted and treated as a comment.
9. In System/360 COBOL, declaratives are compiler - directing statements that specify the circumstances under which a procedure is to be executed in the object program. The USE sentence specifies the type of declarative.
10. System/360 has added the following COBOL words to the vocabulary of reserved words. They should not be used except in the specified context:

## 7080 - O.S. 360 COBOL DIFFERENCES

ACCEPT Statement.

7080 ACCEPT data-name (FROM mnemonic-name).

The standard ACCEPT device is the card reader.

Mnemonic-name, if specified, must be defined in the SPECIAL-NAMES paragraph.

360 ACCEPT data-name (FROM CONSOLE).

When FROM CONSOLE is specified, data-name may not exceed 72 characters in length. When the FROM CONSOLE option is not written, one logical record is read from the system logical input device (SYSIN).

ADD Statement.

ADD and ADD CORRESPONDING formats are unchanged.

7080 Computation on report items is permitted.

\* 360 Either TO or GIVING is required in an ADD statement. There must be no OCCURS clause governing any of the operands involved in an ADD CORRESPONDING statement.

Arithmetic Expressions.

360 An expression having a succession of exponentiation operators separating a series of operands is evaluated as though parentheses were inserted from the right. Thus,  $A**B**C = (A**(B**C))$ . The minus sign ~~is~~ <sup>or plus are</sup> the only allowable unary operator.

7080 When the sequence of execution is not specified by the parentheses, the order of execution of consecutive operations of the same hierarchical level is from left to right.

Both the plus and minus signs are valid unary operators.

AT END Condition.

7080 AT END statement - 1 ELSE statement - 2.

AT END is implied for statement - 2.

360 AT END imperative - statement.

AT END may not be implied.

BLANK Clause.

BLANK WHEN ZERO. Same format.

7080 May be used only in the description of an elementary item.

360 May be used only in the description of elementary report or numeric - form items. Numeric - form items to which it is applied are considered to be report items. The BLANK clause may not be applied to an item having an \* in its picture.

BLOCK CONTAINS Clause.

7080 BLOCK CONTAINS integer-1 (RECORD, RECORDS, CHARACTERS).

360 BLOCK CONTAINS integer-1 RECORDS.

Specifies the number of records of maximum length in a physical record.

CLASS Clause.

7080 CLASS IS (\_\_\_\_\_).

This clause is not implemented by System/360.

A PICTURE clause should be used to express the functions of this clause.

CLASS Test.

7080 IF data - name IS (NOT) (NUMERIC, ALPHABETIC),

Data name must be defined in the Data Division as being of the alphanumeric class.

360 Data-name IS (NOT) (NUMERIC, ALPHABETIC), The item to be tested can be elementary alphanumeric, alphabetic, internal decimal, or external decimal.

CLOSE Statement.

7080 CLOSE file - name-1 (WITH LOCK),...

360 CLOSE file - name-1 ((UNIT) (WITH (LOCK, NO REWIND))),...

The reserved word UNIT replaces the current systems equivalent, REEL.

If the UNIT option is specified, the IOCS volume switching procedures are instituted.

COBOL Program Sheet - Margin Restrictions

For System/360 COBOL, margin A (columns 8 through 11) is restricted to the following entries:

Division Names

Section Names

Paragraph Names

Level Indicators

No other entries may begin before column 12.

Collating Sequence.

360 Comparison of non-numeric items is with respect to the binary collating sequence of characters in the IBM extended BCD interchange code.

Conditional Statement.

IF condition-1 (THEN) (statement-1, NEXT SENTENCE) ((ELSE, OTHERWISE) (statement-2, NEXT SENTENCE)). For Level E statement-1 must be imperative.

Continuation Indicator.

7080 A hyphen must be punched in column 7 of any line in which a word or literal is being continued.

360 A hyphen must be punched in column 7 of each line in which a non-numeric literal is being continued. Continuation of words or numeric literals is not permitted.

Data Division.

System/360 does not implement a Constant Section. Additions are as follows: Sort Description Entries, Saved Area Entries, Linkage Section, and Report Section.

Declaratives.

PROCEDURE DIVISION.

DECLARATIVES.

(section-name SECTION.

USE sentence.

((paragraph-name.)

sentence... .)...)...

END DECLARATIVES.

360 The USE sentence identifies the type of declarative. There are four options of the USE sentence. Each identifies one of the following types of processing:

1. Label-checking procedures.
2. Label-writing procedures.
3. Asynchronous processing procedures.
4. Report-writing procedures.

DISPLAY Statement.

7080 DISPLAY (data-name-1, literal-1) (UPON mnemonic-name).

If UPON is omitted, the console typewriter is assumed as the standard display device.

360 DISPLAY (data-name-1, literal-1) ((UPON (CONSOLE, SYSPCH)).

When the UPON option is omitted, the system logical output device (SYSOUT) is assumed. The sum of the operands may not exceed the maximum logical record length for SYSOUT.

If the UPON option is specified, the sum of the sizes of the operands may not exceed 72 character positions.

Editing Clause.

7080 (ZERO SUPPRESS, CHECK PROTECT, FLOAT DOLLAR SIGN) ((LEAVING integer-1 (PLACE, PLACES)).

This clause is not implemented by System/360. A PICTURE clause should be used to express the functions of this clause.

ENTER Statement.

7080 ENTER (AUTOCODER, COBOL).

360 ENTER LINKAGE.

(CALL statement., ENTRY statement., RETURN statement.)

ENTER COBOL.

The ENTER statement, used in conjunction with ENTRY or CALL statements, permits communication between a COBOL object program and one or more subprograms or other language subprograms.

#### ENTRY Statement

360 ENTRY entry-name (USING data-name).

This statement is used to establish an entry point in a COBOL subprogram. Control is transferred to the entry point by a CALL statement in another program.

Entry-name defines the entry point.

Data-name must be defined in the LINKAGE SECTION.

#### ENVIRONMENT DIVISION.

The nature of the Environment Division is such that it must be rewritten entirely whenever the program is to be processed for a different computer.

#### Figurative Constant

ALL "literal"

System/360 requires that literal be a single character bounded by quotation marks.

#### GO TO Statement.

GO TO procedure-name-1 procedure-name-2 (procedure-name-3...)

DEPENDING ON data-name.

Data-name must be an elementary integral numeric item whose length does not exceed four digits.

#### IDENTIFICATION DIVISION.

7080 PROGRAM-ID. program-name.

(AUTHOR, AUTHORS). author-name.

Program-name must be either a name or a literal.

360 PROGRAM-ID. "program-name"

(AUTHOR. Author-name.)

Program-name must consist of from one to eight letters and (or digits, first character must be alphabetic, the whole enclosed in quotation marks. The program-name identifies the object program to the control program.

INVALID KEY condition.

360 INVALID KEY imperative-statement.

Applicable to random access devices.

JUSTIFIED Clause

360 JUSTIFIED RIGHT

This clause can only be used with elementary alphabetic or alphanumeric items.

LABEL RECORDS Clause.

7080 LABEL (RECORD, RECORDS) (IS, ARE) (OMITTED, STANDARD  
(BEGINNING-TAPE-LABEL) (NO-TAPEMARK) (ENDING-TAPE-LABEL)).

360 LABEL RECORDS ARE (OMITTED, data-name).

For other than unit-record devices, the OMITTED option implies either:

1. That there are no user labels on input, or
2. That user input labels are to be bypassed, or
3. That user labels are not created on output.

Use of the data-name option means that user labels can be processed in the declaratives section. Data-name must be described in the linkage section.

Literals. Numeric, Non-numeric, Figurative

1. HIGH VALUE(S) and LOW VALUE(S) are not implemented.
2. ZERO and its plural forms are not permitted in arithmetic statements.

MOVE CORRESPONDING data-name-1 TO data-name-2.

Implemented in the 360 level F compiler.

OCCURS Clause.

7080 OCCURS integer-1 (TIME, TIMES).

Must not be used in a record description entry having a level number of 77.

360 OCCURS integer-1 TIMES (DEPENDING ON data-name).

System 360 does not permit the use of an OCCURS clause in a level-88 entry.

Integer-1 represent a maximum in regards to the value of data-name.

OPEN Statement is different.

PERFORM Statement is identical

7080 The use of TIME and THROUGH in lieu of TIMES and THRU, respectively is permitted.

360 TIME and THROUGH are not permitted.

Data-name must have an integral value and data-name or integer must have a positive value, less than 32,768.

PICTURE Clause.

7080 PICTURE IS (alphabetic-form, numeric-form, alphanumeric-non-report, alphanumeric-report)

The single character pictures "J" and "K" represent a record mark and group mark, respectively. If the picture of an item specifies an implied decimal point, (symbol "V"), it cannot contain more than 99 positions on either side of the decimal point. Numeric items in arithmetic expressions are limited to 18 numeric characters. Report items are limited to 18 numeric characters. Z and \* cannot appear in the picture. They may not appear in the same picture with a floating dollar sign. They may appear to the right of an assumed or actual decimal point only if no numerics appear.

360 PICTURE IS (Alphabetic-form, numeric-form, alphanumeric-form, report-form, floating-point-form). The picture symbol "X" is the only valid symbol for an alphanumeric item. Report-form is not a subdivision of the alphanumeric class.

#### Punctuation.

360 A semicolon may be used optionally to separate a series of statements or clauses.

#### READ Statement.

7080 READ file-name RECORD (INTO area-name).

When the INTO option is specified, the record is read directly into area-name. The record currently in the record area associated with the input file remains available.

360 READ file-name RECORD (INTO data-name).

If the INTO option is specified, the current record becomes available in the input area as well as in the area specified by data-name.

RECORD CONTAINS Clause.

7080 RECORD CONTAINS (integer-1 TO) integer-2 CHARACTERS.

360 RECORD CONTAINS (integer-1 TO) integer-2 CHARACTERS (WITHOUT COUNT CONTROL).

This clause is required if variable length records are described for the file. It is not necessary for a file having equal length records. If the WITHOUT COUNT CONTROL option is specified, the file is assumed to contain undefined-length or fixed length records and the BLOCK CONTAINS clause may not be specified for the file.

Record Description Entry.

360 (77,01) data-name COPY library-name.

level-number (FILLER, data-name) (REDEFINES Clause) USAGE Clause) (OCCURS Clause) (VALUE Clause) (SYNCHRONIZED Clause) (BLANK Clause) (PICTURE Clause) (JUSTIFIED Clause).

7080 SIZE, POINT, and Editing Clauses are functionally replaced by the PICTURE Clause.

RECORDING MODE Clause

7080 RECORDING MODE IS mode.

System/360 does not implement this clause.

REDEFINES Clause.

Both: data-name-1 REDEFINES data-name-2.

7080 Multiple redefinitions are possible, provided that they occur at the same level and without other entries intervening at that level.

An entry containing the REDEFINES clause must not be written at a lower level within another entry containing the REDEFINES clause, unless the latter entry is at the 01 level, in which case one such lower level redefinition is permitted at a time.

360 REDEFINES clauses may be specified for items subordinate to items containing REDEFINES clauses. Data-name-1 may not contain or subordinate an OCCURS DEPENDING clause, nor be subordinate to an item containing an OCCURS clause. Data-name-2 may not be subordinate to nor contain an OCCURS clause, nor subordinate an item containing an OCCURS DEPENDING clause. No lower level-number entries may intervene between data-name-1 and data-name-2. Length of data-name-1 times occurrences must not be greater than the length of data-name-2.

#### Relation Test

360 (data-name, literal, arithmetic expression, figurative-constant)  
IS (NOT) (<, >, =, GREATER THAN, LESS THAN, EQUAL TO) (data-name, literal, arithmetic expression, figurative-constant).

Reserved System/360 Only

CHANGED	FORM-OVERFLOW	RELATIVE
CHECKING	HOLD	RESTRICTED
COMPUTATIONAL - 3	IBM-360	REWRITE
CONSOLE	INDEXED	SA
CREATING	LABELS	SEARCH
CYCLES	LINKAGE	SYSPCH
DIRECT-ACCESS	MORE-LABELS	TRACE
DISPLAY-ST	NAMED	TRACKS
ENTRY	ORGANIZATION	TRANSFORM
EXHIBIT	PRINT-SWITCH	UNIT-RECORD
FILE-ID	PROGRESS	UNITS
WITHOUT	READY	UTILITY

These words are not reserved in any of the current systems vocabulary.

SIGNED Clause.

7080 SIGNED

This clause is not implemented by System/360.

A PICTURE clause should be used to express the functions of this clause.

SIZE Clause.

7080 SIZE IS integer-1 (CHARACTER, CHARACTERS, DIGIT, DIGITS)

This clause is not implemented.

SIZE ERROR Condition.

7080 ON SIZE ERROR (statement-1, NEXT SENTENCE) ((OTHERWISE, ELSE)  
(statement-2, NEXT SENTENCE)).

For compatibility with System/360, the option should not be used.

360 ON SIZE ERROR imperative-statement.

#### STOP Statement

360 STOP (RUN, literal).

STOP RUN returns control to the operating system. STOP literal causes a compiler-generated message code, as well as the specified literal, to be displayed. The message code must be keyed in on the console in order to resume.

#### SYNCHRONIZED Clause

7080 SYNCHRONIZED (LEFT, RIGHT).

The SYNCHRONIZED Clause is never necessary in a System/360 COBOL program. If the clause is specified, it is treated as comments by the compiler.

#### Test Condition

7080 Switch-status-name Test

The System/360 environment does not provide for testing switch-status.

#### USAGE Clause

7080 USAGE IS (COMPUTATIONAL, DISPLAY).

The DISPLAY option is not meaningful and is ignored. If an item is specified as being COMPUTATIONAL, it must be a numeric item.

360 USAGE IS (DISPLAY, COMPUTATIONAL, COMPUTATIONAL-1, COMPUTATIONAL-2, COMPUTATIONAL-3).

DISPLAY specifies character form, one character per byte.

COMPUTATIONAL specifies a binary item occupying 2, 4, or 8 byte positions corresponding to the specified decimal lengths of 1-4, 5-9, and 10-18 respectively. The leftmost bit of the reserved area is the operational sign. Computational items are aligned at the next half or full word boundaries, as appropriate. COMPUTATIONAL-1 short-precision floating point. COMPUTATIONAL-2 long-precision floating point. COMPUTATIONAL-3 packed decimal.

USE Statement. Check the manual.

VALUE Clause.

Both VALUE IS literal.

7080 The VALUE clause cannot be used to describe a report item.

It can be used to describe a group item, provided neither a decimal point nor an operational sign are part of the literal, and the size of the literal is equal to the size of the group item. A figurative constant may not be used for the predicate of a VALUE clause used at the group level, unless a SIZE clause is also present.

360 A VALUE clause can be used:

1. For elementary items only.
2. In File and Linkage Section, in level 88 entries only.

The VALUE clause cannot be used:

1. For group items.
2. For report items.
3. For external floating-point items.
4. For items containing, or subordinate to an OCCURS clause or a REDEFINES clause (except for level 88 entries).

VALUE OF Clause.

360 VALUE OF FILE-ID IS external-name.

This clause specifies the name by which the file is known to the control program. Any other format is invalid.

WRITE Statement.

7080 WRITE record-name (FROM area-name).

The record is written directly from the area designated by area-name. Any record in the normal record area associated with the file is still available for processing.

360 WRITE record-name (FORM data-name-1) (INVALID KEY imperative-statement) (AFTER ADVANCING (data-name-2, integer) LINES).

When the AFTER ADVANCING option is used, the first character in each logical record for the file must be reserved for the control character. If an integer is specified, it must be unsigned and have the value 0, 1, 2, or 3.
